

Cyber Security (CSWG) Assessment of PAP-04

Status: Approved

Were CSWG requirements met? The document does not address cybersecurity.

Comments: The CSWG recommends that the OASIS WS-Calendar document be accepted as is, but that corresponding documents be developed or when this document is updated in future efforts (in a DEWG or PAP) that:

- Provide security requirements at the Syntactic Interoperability layer for web scheduling-calendar transactions. These security requirements should cover confidentiality, integrity and availability, either by inclusion, reference, or both.
- Provide security guidance for those information model standards that consist substantially of XML-based data structures. Such guidance can reference existing standards and explain alternatives and options for applying them to secure files and communications exchanges in XML-based formats.
